Methods of Search

$s(X,Y,C)$, with C a cost of transitioning from state X to Y. $\hat{s}(X,Y)$ is true if there is a legal/possible movement from X to Y. $\hat{\quad}$ In the blocks problem.

Tree Current search sub tree. Many people use not optimal because it directly searches for computers for various things. This illustrates that the design of good datastructures is as important in Prolog as it is in any other programming language.

In our case, this would mean finding an optimal solution as the first solution. Sometimes a proof is based on failure to prove. The sign is used to indicate whether a variable on either side of operator is a constrained variable to be handled by the FD problem solver instead of backtracking.
